WORKING PAPERS	“Procedural Decision-Making in the Face of Complexity” with Kirby Nielsen <i>Revising for the Quarterly Journal of Economics (Reject & Resubmit)</i> A large body of work documents that complexity affects individuals’ choices, but the literature has remained mostly agnostic about why. We provide direct evidence that individuals use fundamentally different choice processes for complex and simple decisions. We hypothesize that individuals resort to “procedures”—cognitively simpler choice processes that we characterize as being easier to describe to another person—as the complexity of the decision environment increases. We test our hypothesis using two experiments, one with choices over lotteries and one with choices over charities. We exogenously vary the complexity of the decision environment and measure the descriptibility of choice processes by how well another individual can replicate the decision-maker’s choices given the decision-maker’s description of how they chose. We find strong support for our hypothesis: Both of our experiments show that individuals’ choice processes are more describable in complex choice environments, which we interpret as evidence that decision-making becomes more procedural as complexity increases. We show that procedural decision-makers choose more consistently and exhibit fewer dominance violations, though we remain agnostic about the causal effect of procedures on decision quality. Additional secondary evidence suggests that procedural decision-making is a choice simplification that reduces the cognitive costs of decision-making. “The Inference Cost of Policies” with Maxim Bakhtin <i>Revising for the European Economic Review</i> Effective policymaking requires balancing the need for desirable outcomes with the ability to learn valuable information. However, when policies promote uniform behavior, they can hinder	

the ability to infer information from people's actions. We propose that individuals may select suboptimal policies because they fail to consider the effects of inference. To test this hypothesis, we conduct an online experiment that simulates a hiring scenario with an initial trial task. Participants make two decisions: selecting a trial task and then choosing which candidate to hire. The majority of participants opt for the suboptimal task that does not reveal the candidates' quality. This leads to suboptimal hires and lower payoffs because these participants do not know which candidate is better. Our findings suggest that the primary mechanism driving this behavior is the failure to anticipate inference. Our study underscores the significance of accounting for the effects of inference when designing policies.

“What You Don’t Know May Hurt You: Preferences Over Mental And External States” with Lukas Bolte

The dominant approach to welfare, revealed preference, is restricted to settings where the individual knows their preferences have been fulfilled. We use a choosing-for-others framework to experimentally study welfare when what the individual believes differs from what is actually true. 42% of participants see welfare as independent of beliefs; 22% see welfare as exclusively determined by beliefs; and 29% care about both beliefs and reality. Furthermore, the average participant values accurate beliefs. While there is large heterogeneity, our results suggest most people support the idea that welfare goes beyond beliefs, which can inform media regulation, informational policies, and government communication.
